MAYON VOLCANO UPDATE
27 September 2008
8:00 A.M.

Mayon Volcano's (13.2576°N, 123.6856°E) seismic network detected one (1) volcanic earthquake during the past 24 hours. During clouds break, steaming activity was moderate with white steam drifting to the southeast and northeast. Crater glow was not observed due to thick clouds that covered the volcano's summit.

Alert Level 1 remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
