MAYON VOLCANO UPDATE
03 October 2008
8:00 A.M.

The seismic network around Mayon Volcano (13.2576°N, 123.6856°E) detected three (3) volcanic earthquakes during the past 24 hours. Steaming activity at the summit crater was moderate with white steam drifting towards the northeast. Last night observation showed that faint crater glow remained at Intensity 1.

Alert Level 1 remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
