MAYON VOLCANO UPDATE
04 October 2008
8:00 A.M.

Mayon Volcano's (13.2576°N, 123.6856°E) seismic network detected fourteen (14) volcanic earthquakes during the past 24 hours. Steaming activity at the summit crater was moderate with white steam drifting towards the northeast. Crater glow was not observed last night due to thick clouds that covered the volcano's upper slope.

Alert Level 1 remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
