MAYON VOLCANO UPDATE
14 October 2008
8:00 A.M.

Mayon Volcano's (13.2576°N, 123.6856°E) seismic network detected nine (9) volcanic earthquakes during the past 24 hours. Daytime observation of steaming activity was obscured by thick clouds at the summit and faint (intensity I) crater glow was observed during intermittent cloud breaks last night.

Alert Level 1 remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
