MAYON VOLCANO UPDATE
18 December 2008
8:00 A.M.

Mayon Volcano's (13.2576°N, 123.6856°E) seismic network detected one (1) volcanic earthquake during the past 24 hours. Steaming activity was moderate with white steam clouds creeping downslope towards northwest. Faint crater glow (Intensity I) was observed last night.

Alert Level 1 remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
