MAYON VOLCANO UPDATE
20 December 2008
8:00 A.M.

Mayon Volcano's (13.2576°N, 123.6856°E) seismic network detected one (1) volcanic earthquake during the past 24 hours. Steaming activity was moderate with white steam clouds drifting towards north-northwest. Crater glow was not observed due to thick clouds that covered the upper slope of the volcano.

Alert Level 1 remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
