**MAYON VOLCANO UPDATE**  
**30 December 2008**  
**8:00 A.M.**

Six (6) volcanic earthquakes were detected by Mayon Volcano's (13.2576°N, 123.6856°E) seismic network during the past 24 hours. Wispy to moderate steaming was observed drifting west northwest. Crater glow at the volcano's summit was not observed the whole night.

**Alert Level 1** remains hoisted over Mayon Volcano. The public is reminded that the 7-km Extended Danger Zone (EDZ) at the southeastern flank of the volcano and the 6-km radius Permanent Danger Zone (PDZ) at other areas remain off-limits due to the continuing threat from sudden explosions and rockfalls from the upper slopes. Active river channels and those areas perennially identified as lahar-prone around the volcano should be avoided when there is heavy and prolonged rainfall.
